

Sally Beckner

I see at least a partial solution to two problems here. The first problem is linked to water scarcity, in particular the potential use of millions of gallons by proposed and existing data centers. The second problem is the overabundance of produced water and how to clean it for use. It seems that this water could be cleaned enough to be used by data centers and other industries for their cooling needs. This way, clean water would be reserved for consumption and irrigation of food crops which is so desperately needed.
